

Sales Analysis – Codes, Outputs, and CSV Data

This document contains: **Code listings** used for data processing and export. **Outputs:** full cleaned dataset with *total_sale_value* and the *Top 5 Stores* summary. **All CSV inputs** embedded as tables. Total cleaned rows: **6**. Distinct stores: **3**.

Code Listings

Data Processing Pipeline

```
import pandas as pd
import glob
import os
path = "your_csv_folder_path"
all_files = glob.glob(os.path.join(path, "*.csv"))
df_list = [pd.read_csv(file) for file in all_files]
df = pd.concat(df_list, ignore_index=True)
df = df.dropna()
df = df.drop_duplicates()
df['total_sale_value'] = df['price'] * df['quantity']
store_sales = df.groupby('store_id', as_index=False)['total_sale_value'].sum()
top_5_stores = store_sales.sort_values(by='total_sale_value', ascending=False).head(5)
```

Export to Excel and ZIP

```
import zipfile
with pd.ExcelWriter("final_sales_report.xlsx", engine="openpyxl") as writer:
    df.to_excel(writer, sheet_name="Cleaned_Data", index=False)
    top_5_stores.to_excel(writer, sheet_name="Top_5_Stores", index=False)
with zipfile.ZipFile("sales_report_package.zip", "w") as zipf:
    zipf.write("final_sales_report.xlsx", "final_sales_report.xlsx")
for file in all_files:
    zipf.write(file, os.path.basename(file))
```

PDF Generation Snippet

```
from reportlab.platypus import SimpleDocTemplate, Paragraph, Spacer, Table, TableStyle, PageBreak
from reportlab.lib.styles import getSampleStyleSheet, ParagraphStyle
# Build a PDF with code listings, outputs, and CSV tables.
```

Output – Full Cleaned Dataset

store_id	price	quantity	total_sale_value
1	100	2	200
2	200	1	200
1	150	3	450
2	300	1	300
3	120	2	240
3	250	1	250

Output – Top 5 Stores by Revenue

store_id	total_sale_value
1	650
2	500
3	490

Input CSV Data (Raw)

File 1: sales1.csv

store_id	price	quantity
1	100	2
2	200	1
1	150	3

File 2: sales2.csv

store_id	price	quantity
2	300	1
3	120	2
3	250	1
